Universität Potsdam

What is a Network?

- A *network* is a (finite) collection of entities together with a specified pattern of relationships among these entities.
- Three main tools have been used for the quantitative study of networks:
 - graph theory;
 - statistical and probability theory;
 - algebraic models.

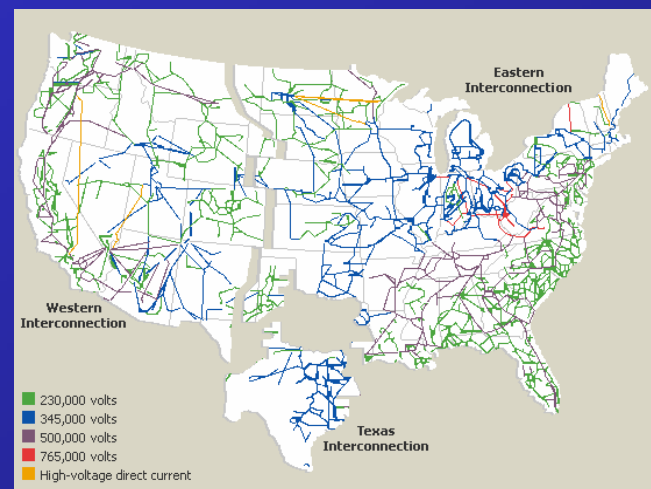

1. INTRODUCTION

Technological Networks

World-Wide Web

Internet

Power Grid

1. INTRODUCTION

Social Networks

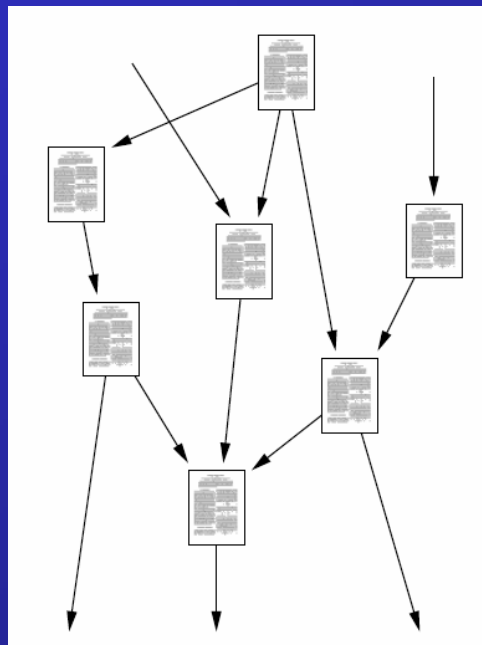

Friendship Net

Movie Actors

Sexual Contacts

Citation Networks

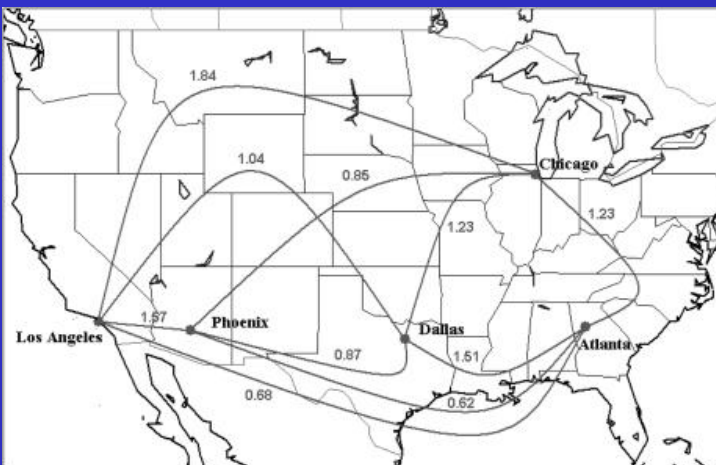

Collaboration Networks

Transportation Networks

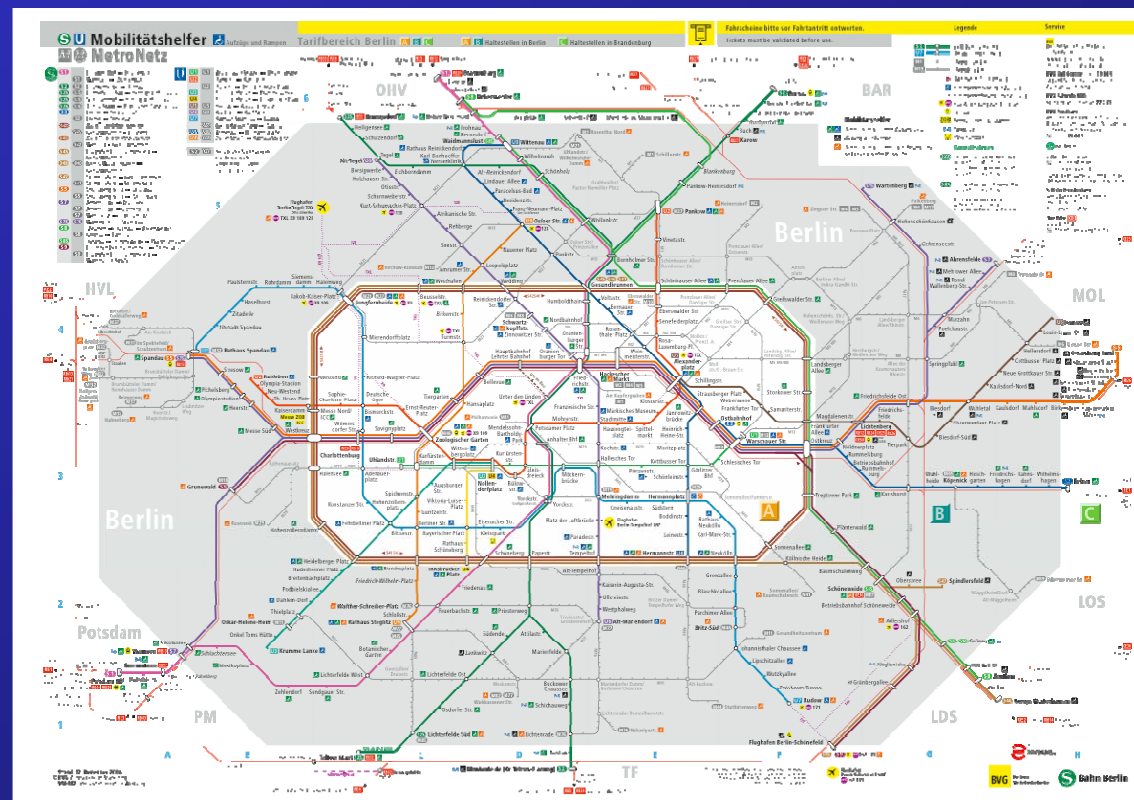

Airport Networks

Road Maps

Local Transportation

1. INTRODUCTION

Biological Networks

Ecological Webs

Protein interaction

Neural Networks

Genetic Networks

Metabolic Networks

2. NETWORKS...

GOAL: A **unified approach**

enabling analysis of the

connection topology

underlying various

Complex Systems

Example: Food Web

Graphical Approach: Vertices and Edges

$A_{ij} = 1$ iff (i,j) is in the
Edge Set $E(G)$

2. NETWORKS...

Graphical Approach...

Simple Graph

Directed Graph G (DiGraph)

$A_{ij} = 1$ iff (i,j) is in the edge set $E(G)$

Non-Symmetrical DiGraph Adjacency Matrix

	1	2	3	4	5	6	7	8
1	0	0	1	0	0	0	0	0
2	1	0	0	1	0	0	0	0
3	1	1	0	0	0	1	0	0
4	0	0	0	0	0	0	1	0
5	0	1	0	1	0	1	1	0
6	0	0	0	0	1	0	0	1
7	0	0	0	0	0	0	0	1
8	0	0	0	0	0	0	1	0

2. NETWORKS...

Graphical Approach...

Simple Graph

DiGraph

Weighted DiGraph

2. NETWORKS...

Structural Characterization

Simple Graph

e.g. Trade Network

Vertex Degree: $k(v)$

$$k(\bullet) = 3$$

2. NETWORKS...

Structural Characterization...

Clustering Coefficient: $C(v)$

Simple Graph

e.g. Trade Network

2. NETWORKS...

Structural Characterization...

Simple Graph

e.g. Trade Network

Clustering Coefficient: $C(v)$

- Degree of vertex v (number of directly connected vertices): $k(v) = 3$

2. NETWORKS...

Structural Characterization...

Clustering Coefficient: $C(v)$

Simple Graph

e.g. Trade Network

- Degree of vertex \bullet : $k(\bullet) = 3$
- Total number of possible connections among these 3 neighbors:

$$\frac{1}{2} \cdot k(v) \cdot [k(v) - 1] = \frac{1}{2} \cdot [3 \cdot 2] = 3$$

Structural Characterization...

Clustering Coefficient: $C(v)$

Simple Graph

e.g. Trade Network

- Number of actual connections among the three neighbors = 1
- Total number of possible connections:
 $\frac{1}{2} \cdot k(v) \cdot [k(v) - 1] = \frac{1}{2} \cdot [3 \cdot 2] = 3$
- $C(v) = 1 / 3 = 0.33333$
- Measures how well my neighbors are connected to each other!

2. NETWORKS...

Structural Characterization...

Simple *Connected* Graph

e.g. Trade Network

“Distance” V_i to V_j ?

2. NETWORKS...

Structural Characterization ...

Simple Connected Graph

e.g. Trade Network

Length of this path V_i to $V_j = 4$

2. NETWORKS...

Structural Characterization...

Simple Connected Graph

e.g. Trade Network

Length of this path V_i to $V_j = 3$

2. NETWORKS...

Structural Characterization...

Simple Connected Graph

e.g. Trade Network

DISTANCE V_i to V_j = Shortest path length V_i to V_j , here equal to 3

2. NETWORKS...

Structural Characterization...

Simple Connected Graph

e.g. Trade Network

Distance from vertex V_i
to each other vertex v ?

2. NETWORKS...

Structural Characterization...

Simple Connected Graph

e.g. Trade Network

Distance-1 Vertices from Vertex V_i

2. NETWORKS...

Structural Characterization...

Simple Connected Graph

e.g. Trade Network

Distance-2 Vertices from Vertex V_i

2. NETWORKS...

Characterization

Distance 3-Vertices from Vertex V_i

Simple Connected Graph

Distance L_{ij} : Length of the SHORTEST path(s) from V_i to V_j

2. NETWORKS...

$L(G)$ = Characteristic Path Length of Graph G

- All-to-all distance matrix:

L_{ij} Length of the shortest path(s)

	1	2	3	4	5	6	7	8	9
1	0	1	1	2	2	2	3	3	4
2	1	0	1	1	1	2	2	3	4
3	1	1	0	2	2	1	3	2	3
4	2	1	2	0	1	2	1	2	3
5	2	1	2	1	0	1	1	2	3
6	2	2	1	2	1	0	2	1	2
7	3	2	3	1	1	2	0	1	2
8	3	3	2	2	2	1	1	0	1
9	4	4	3	3	3	2	2	1	0

$L(G)$ = Average of L_{ij} over all vertices V_i and V_j ($i \neq j$) in $V(G)$ = 1.94

2. NETWORKS...

E-R Random Graph Model

Paul Erdős & Alfréd Rényi (*Hungarian Academy of Sciences*, 1960):

Start with a collection
of N unconnected vertices.

Then, for each distinct pair
of vertices, connect them
by an edge with probability p .

Denote the resulting graph as
 $G = G(N, p)$

2. NETWORKS...

E-R Random Graph Model...Continued

- Degree distribution: $P_G(k)$

$N=1020$
 $p = 0.2$

Poissonian!

$P_G(k)$ = Probability that a randomly selected vertex in G will have degree k

$P_G(k) \sim [e(-z) z^k] / k!$
where $z = \text{mean } k$ (depends on N, p)

2. NETWORKS...

Graph G for a Regular Ring Lattice

- Regular = Every vertex has the same degree
- $|V(G)| = \text{No. of Vertices} = 16$
- Degree $k = 4$
- Clustering: $C(G) = 1/2$
- Characteristic Path Length:
 $L(G) = 36/15 = 12/5$

2. NETWORKS...

Small-World Network (SWN) Models

Duncan Watts & Steven Strogatz (*Nature*, 1998):

Construction of SWN $G(p)$, $0 \leq p \leq 1$

Choose a vertex v and edge e^* that connects v to its nearest neighbor v^* in clockwise direction.

With probability p , reconnect edge to a vertex v^{**} chosen uniformly at random over the ring but with duplicate edges forbidden.

Continue process clockwise around ring until 1 lap is complete.

2. NETWORKS...

SWN Models...Continued

Watts-Strogatz 1998: Construction of Small-World Network $G(p)$

Next consider edges e at distance 2 from from each v in clockwise direction, and randomly rewire with probability p .

Moving clockwise, complete a full lap of distance-2 rewiring.

In general, for a ring of any degree k , successively rewire ALL edges with probability p by completing $k/2$ laps around ring.

Rewired edges are called “SHORT-CUTS”

2. NETWORKS...

SWN Models...Continued

Watts-Strogatz 1998: Construction of Small-World Network $G(p)$

- For a range of p 's with $0 < p < 1$, the SWN $G(p)$ is characterized by
 - High clustering $C(p)/C(0)$
 - Short path length $L(p)/L(0)$

Watts, Strogatz. Nature 393/4, 1998

2. NETWORKS...

SWN Models...Continued

Albert-László Barabási (A-B) **Scale-Free Network** (*Science*, 1999):

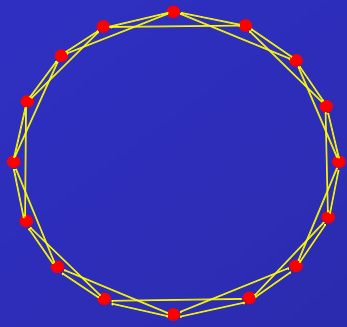

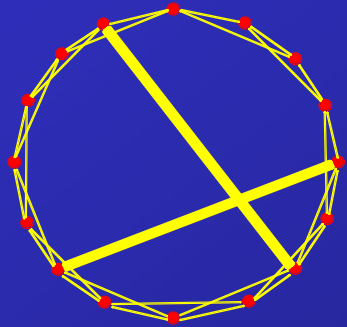

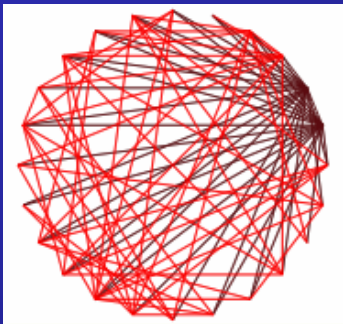

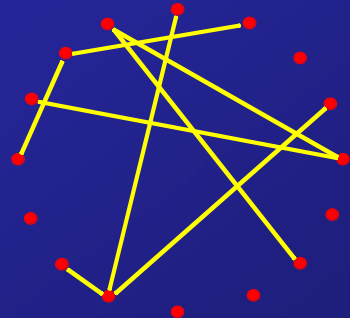

- At each step add new vertex v to graph and connect it to 2 randomly selected existing vertices v_i using “preferential attachment” prob’s

$$p_i = \frac{k_i}{\sum_j k_j} = \text{Prob}(v_i)$$

- Results:
 - “Richer-Get-Richer”
 - $P_G(k) \sim k^{-3}$ (Power Law = Scale Free)

2. NETWORKS...

Properties of the Network Models

	Regular	W-S Small-World	A-B Scale Free	E-R Random
				
Path length	Long	Short	Short	Short
Clustering	Large	Large	Large	Small
SWNs fall "between" regular networks and E-R random networks!				

2. NETWORKS...

Properties of the Network Models...

Regular Lattice

$P_G(k) = \delta(k - k_{\text{True}})$:
Delta Function equals 1 at
true degree k and 0 elsewhere

A-B Scale-Free SWN

$P_G(k) \sim k^{-3}$
power law

E-R Random Graph

$P_G(k) \sim [e(-z)z^k]/k!$
z = mean k

2. NETWORKS...

Small-World Nets: Robustness to Shocks

- **Network Resilience:**
 - Highly robust against RANDOM failures of vertices v

2. NETWORKS...

Small-World Nets: Significant Impacts

- **Network Resilience:**
 - Highly robust against RANDOM failures of vertices v

Small-World Nets: Significant Impacts

- **Network Resilience:**

- Highly robust against RANDOM failures of vertices

- **BUT** highly vulnerable to deliberate attack on HUBS (v's having a relatively high degree k)

Small-World Nets: Significant Impacts

- **Network Resilience:**
 - Highly robust against RANDOM failures of vertices
 - **BUT** highly vulnerable to deliberate attack on HUBS

2. NETWORKS...

So how well do YOU know Kevin Bacon?

- **Small-World Effect** = Hypothesis that every two people in the world are connected by a surprisingly short chain of social acquaintances.
- **Example:** The trivia game **Six Degrees of Kevin Bacon**

2. NETWORKS...

Six Degrees of Kevin Bacon...

- Name taken from 1990 stage play by American playwright John Guare: *Six Degrees of Separation*
- Play loosely based on 1967 small-world experiment by Stanley Milgrom suggesting random pairs of U.S. citizens were connected on average by a chain of six social acquaintances (people on a first-name basis).
- Pick any **film actor A**, then try to link this actor to Bacon via a chain of films.
- Actor set for first film in chain must include A, each successive film must include an actor from previous film, and final film must include Bacon among its actors.

2. NETWORKS...

Six Degrees of Kevin Bacon....

Example: (from Wikipedia, accessed 4/8/07)

http://en.wikipedia.org/wiki/Six_Degrees_of_Kevin_Bacon

- **Elvis Presley** was in *Change of Habit* (1969) with Edward Asner
- Edward Asner was in *JFK* (1991) with Kevin Bacon
- Therefore Elvis Presley has a Bacon Number = 2.

2. NETWORKS...

What's the average distance between Kevin Bacon and all other actors?
(from Albert-László Barabási, www.nd.edu/~networks)

Kevin Bacon

No. of movies : 46 No. of actors : 1811
Average separation: 2.79

*Is Kevin Bacon
the most
connected actor?*

NO!

Rank	Name	Average distance	# of movies	# of links
1	Rod Steiger	2.537527	112	2562
2	Donald Pleasence	2.542376	180	2874
3	Martin Sheen	2.551210	136	3501
4	Christopher Lee	2.552497	201	2993
5	Robert Mitchum	2.557181	136	2905
6	Charlton Heston	2.566284	104	2552
7	Eddie Albert	2.567036	112	3333
8	Robert Vaughn	2.570193	126	2761
9	Donald Sutherland	2.577880	107	2865
10	John Gielgud	2.578980	122	2942
11	Anthony Quinn	2.579750	146	2978
